Applicant UNAX	XIS BALZERS AKTIENO	ESELLSCH	IAFT				
 This international preliminary examination report has been prepared by this International Preliminary Examining Authority and is transmitted to the applicant according to Article 36. This REPORT consists of a total of4 sheets, including this cover sheet. 							
This report is also accompani amended and are the basis for 70.16 and Section 607 of the	ied by ANNEXES, i.e., sheets of r this report and/or sheets contai Administrative Instructions und	the description	n, claims and/or drawings which have been ions made before this Authority (see Rule				
These annexes consist of a to	tal of 3 sheets.	····					
3. This report contains indications relating to the following items:							
I Basis of the report							
II Priority							
III Non-establishment o	of opinion with regard to novelty	, inventive step	p and industrial applicability				
IV Lack of unity of inve	ention						
V Reasoned statement citations and explana	under Article 35(2) with regard ations supporting such statemen	to novelty, inv t	entive step or industrial applicability;				
VI Certain documents of	cited						
VII Certain defects in the international application							
VIII Certain observations	s on the international application	ı					
Date of submission of the demand		Date of completion of this report					
29 April 2004 (29.04.2	2004)	01 A	April 2005 (01.04.2005)

INTERNATIONAL PRELIMINARY EXAMINATION REPORT

International application No.
PCT/CH 03/00710

V. Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

Statement			
Novelty (N)	Claims	1-32	YES
	Claims		NO
Inventive step (IS)	Claims	1-32	YES
	Claims		NO
Industrial applicability (IA)	Claims	1-32	YES
	Claims		NO

2. Citations and explanations

The invention relates to a vacuum arc source that differs from the two documents cited in the search report in that, owing to two oppositely poled magnet systems, the magnetic field components that are perpendicular with respect to the surface are reduced to a constant value that is as small as possible.

Therefore, the problem of inhomogeneous erosion of the target is solved in a simpler manner than in the cited prior art.

The prior art contains nothing that suggests this solution.

The subject matter of claim 1 and of the dependent claims is novel and inventive (PCT Article 33(2) and (3)), subject to rectification of the lack of clarity described below.

The same applies, *mutatis mutandis*, to the method claim 21 and the claims dependent thereon.

Observation:

The prior art describes that the spark vaporizes the

International application No. PCT/CH 03/00710

target on a path that follows the zero point of the perpendicular field component. In light thereof, the wording "essentially constantly small values" in claim 1 does not appear to be clear enough (PCT Article 6) in order to define an inventive difference with respect to the prior art. The reason therefor is the use of "essentially constantly", since a deviation from constancy clearly leads to preferred spark paths, which results in inhomogeneous erosion, thereby no longer solving the problem to be solved by the invention.

In claim 21, the wording "essentially constantly close to or at zero" leads to a lack of clarity since "close to zero" is a relative term that is not suitable for defining the limits of the scope of protection. In addition, a person skilled in the art wonders whether by using "close to zero", something other than "constantly less than 30 Gauss" in claim 1 should be placed under the scope of protection.
